PROBLEM STATEMENT

Automated Movie Ticket Booking system

ABSTRACT

The FILMFORG Movie Ticket Booking System is a desktop-based cinema ticket management application developed using Python, Tkinter, JSON storage, and QR based payment integration. The system allows users to view movies, select seats, pay using multiple methods (QR, Card, Cash), and generate eticke treceipts. The project also features an automated booking scheduler, which opens and closes bookings at predefined times. .FILMFORG is designed to simulate real theatre booking systems with interactive GUI, seat maps, automated flow, and admin-level analytics.

ADVANTAGES

- User Advantages
- Easy-to-use graphical interface
- Multiple payment methods
- Instant QR scanning
- Automated booking opening/closing
- Daily revenue stored and analyzed
- Graph-based profit visualization
- Zero SQL database – uses simple JSON files.

FUTURE ENHANCEMENTS

The FILMFORG system is fully functional, but it can be extended with advance features to make it more efficient, and closer to a real-world cinema booking ecosystem. UserLogin&AuthenticationSystem, Integrati onwithOnlinePaymentGateway, CloudDatabase Integration.

SYSTEM DESIGN

TOOLS AND TECHNOLOGIES USED

- PYTHON
- DATA STRUCTURES
- JSON
- JAVA
- R

CONCLUSION

FILMFORG successfully demonstrates a complete movie ticket booking environment with automated scheduling, real-time seat management, QR payment, and financial analysis.

The system combines GUI design, data handling, real-time automation, and visualization, making it an excellent academic and practical project.

It is scalable, easy to run, and can be enhanced with features like:

- Admin login
- Online cloud database
- Mobile app version
- Show timings per movie
